

SUPPLEMENTAL INSTALLATION INSTRUCTIONS FOR “City Lights”

If your Headlights or Auxiliary lights came with extra miniature “City Lights” and you wonder why or how to wire them up then this instruction should help. You can utilize the existing miniature parking lights which came with your lights or headlights or explore other options described below:

1. As Parking Lights, by using provided miniature bulbs and running any automotive wire from your headlights to your factory wire lead leading to your parking lights and splicing it into that wire lead. The other prong on your miniature bulb should be grounded to any metal surface on the vehicle. Now each time you turn your parking lights your headlights will glow as well.
2. As Turn Signal Lights, by installing an amber miniature incandescent bulb (Part No.03-5053-50B) or high output LED amber bulb (Part No.03-5053-50LA) and running any automotive wire from right and left headlight to your factory wire leading to your right and left blinkers and splicing them into respective wire leads. The other prong on your miniature amber bulb should be grounded to any metal surface on the vehicle.
3. As Daytime Running Lights (DRL), by installing a miniature 20A halogen bulb (Part No.03-5053-50D) or high output LED bulb (Part No.03-5053-50LW) and running any automotive wire from your headlights to your factory wire leading from your ignition and splicing them into that portion of the wire which becomes energized the moment you turn your ignition. The other prong on your miniature amber bulb should be grounded to any metal surface on the vehicle.
4. Other uses like LED red Emergency Lights (Part No.03-5053-50LR) or LED blue Police Lights (part No. 03-5053-50LB) both are reserved for law enforcement, fire and forestry services.
